## Question

Suppose that a r.v. $X$ has the following probability mass function (pmf):

$$
f(x)= \begin{cases}c x, & \text { for } x=1,2,3,4,5 \\ 0, & \text { otherwise }\end{cases}
$$

Determine the value of the constant $c$. Sketch the pmf of $X$ and find the following probabilities:

$$
P\{X<1\}, P\{-1<X<3\}, P\{X>1\}
$$

## Answer

From "the total probability is one",

$$
\sum_{i=1}^{5} c i=1
$$

and so $c=\frac{1}{15}$. Consequently

$$
\begin{aligned}
& P\{X=1\}=0 \\
& P\{-1<X<3\}=P\{X=1\}+P\{X=2\}=\frac{1}{5} \\
& P\{X>1\}=1-P\{X=1\}=\frac{14}{15}
\end{aligned}
$$
